PROFESSIONAL SUMMARY

Data & Automation Engineer with 6 years in the GM Brazil / Stellantis ecosystem (via Infosys, Conduent and MSX International). I build Python automations, data pipelines and system integrations that remove manual work and make data reliable, backed by hands-on full-stack projects (FastAPI, PostgreSQL, Airflow, Docker, React, SvelteKit). Results include a daily report cut from 13 minutes to about 20 seconds, process validation time reduced by 81%, and a Power BI model shrunk from 158 MB to 56 MB. Also experienced with SQL, ETL, Power BI and SAP integrations.

TECHNICAL SKILLS

Automation & Integrations: Python, Selenium, Playwright, Power Automate, VBA, REST APIs, Webhooks, OCR/IDP

Backend, Full Stack & Databases: FastAPI, Flask, PostgreSQL, SQLite, Microsoft SQL Server, Docker, Git, React, SvelteKit, TypeScript, JavaScript, HTML/CSS

Data & BI: SQL, Snowflake, ETL, Airflow, Pandas, Power BI, DAX, Power Query, Dataflows, Semantic Models, SharePoint

Machine Learning: Scikit-learn, XGBoost, LightGBM, feature engineering, time-based validation

PROFESSIONAL EXPERIENCE

Mid-level Data Analyst – MSX International | Stellantis South America Jun 2026 – Present
São Caetano do Sul, SP (Brazil) | Customer Experience, data and automation

- Built a Windows desktop application (Python, PySide6/QML) that centralizes the team's recurring routines (data extraction, dealer escalation, daily NPS, survey-base imports) in one portal, now used by 16 people across several areas, with corporate SSO session reuse, automatic retries, failure screenshots and run-time tracking.
- Used Python to pull data from Snowflake and deliver analysis-ready datasets to the team.
- Automated the daily NPS process with Python, cutting report generation from 13 minutes to about 20 seconds (≈97%): data extraction, historical comparison, automatic highlights, an executive PowerPoint with four-month trends, and delivery to leadership via WhatsApp (Node.js).
- Built an interactive web dashboard (HTML/CSS/JavaScript) published on corporate SharePoint, with multi-brand filters, trend charts and Sales and After-Sales history lookup.
- Automated the end-to-end data refresh for datasets of 400k+ (after-sales) and about 250k (sales) records, running about three times a day: extraction from the survey platform (Selenium), file validation and comparison against the previous run, SharePoint publishing and simultaneous refresh of 4 Power BI Dataflows and semantic models via the Power BI REST API, with a pre-load validation against process rules that reduces the risk of publishing inconsistent data for Brazil and South America.
- Automated the monthly dealer escalation process, replacing manual spreadsheet filling and macro-based sending: validates and fills the official Excel workbook from Power BI (REST/DAX) with a post-save audit, tracks dealer feedback in SharePoint, flags the dealers that need escalation by level, generates the per-brand files and sends about 260 e-mails per month across 6 brands through Outlook Web, in test, draft and live modes with per-item logging.
- Restructured 4 Customer Experience scorecards and standardized executive and detailed dashboards for Brazil and South America in Power BI (DAX, Power Query), correcting metric logic (OSAT as average, Top Box method) and optimizing a model from 158 MB to 56 MB with history preserved, cutting refresh time from 30 to 5 minutes (≈83%).

Freelance – Automation and Development Feb 2026 – Jun 2026
Independent clients | Automation, integrations and tools

- Built on-demand automations for independent clients with Google Apps Script, VBA, Python and system integration.
- Delivered solutions such as automated registration through the Mercado Libre API and PDF-to-Excel data extraction with OCR/Tesseract.

Conduent | General Motors Brazil Apr 2021 – Feb 2026
Progression: Administrative Assistant → Junior Financial Analyst → Financial Analyst → Direct Sales Administrative Analyst

- Built an internal Python platform for end-to-end process validation (Oracle CRM, documents, business rules and Outlook), cutting validation time from roughly 3 minutes to 34 seconds (≈81%), with the 34-second cycle stable regardless of daily volume.
- Implemented a document intelligence engine with OCR and a human-in-the-loop feedback cycle: when a field cannot be read (scans, photos, smudged or non-standard PDFs), the analyst fills it in and the system stores the document region as a reference pattern, then reuses that database to read similar documents on its own and validate CPF/CNPJ (Brazilian tax IDs). After one year of testing and tuning, 92% of documents are classified correctly and validated without manual intervention.

- Structured authentication, access control, auditing, encryption of sensitive data, contingency and telemetry, backed by 978 automated tests; Oracle CRM automation with Playwright, background processing, queues and failure recovery.
- Built a Python/PyQt6 desktop system to query and validate 1M+ customer records, replacing a slow, freeze-prone Excel database with indexed SQLite and cutting searches to seconds.
- Automated report consolidation and HTML e-mail dispatch via Python/VBA to 200+ recipients, cutting run time by 75%.
- Built automations in Python, VBA and Access integrated with Outlook, SAP-MM and Oracle CRM; the Access/VBA tax-invoice receiving system led another area to invite me as a Financial Analyst. Processed 5,000+ invoices in a single month in SAP with zero errors, which contributed to my promotion to Junior Financial Analyst.

Senior Process Operator – Infosys | General Motors Brazil Apr 2020 – Apr 2021
São Caetano do Sul, SP (Brazil) | Tax operations and SAP-MM

- Cleared a backlog of more than 20,000 vehicle import invoices and service invoices using internal systems and SAP-MM.

SELECTED PROJECTS

Marketplace Seller Platform – Marketplace automation 2025–2026

- Platform with real Mercado Libre OAuth2, FastAPI backend, multi-tenant PostgreSQL and a layered raw → staging → mart data pipeline orchestrated with Airflow.
- Demonstrates external API integration, data modeling, operational automation and service-oriented architecture.

Applymize – Job application organization and automation platform 2026

- Centralizes job collection, deduplication, fit analysis, funnel organization and application preparation, keeping human review before any final action.
- Stack: Python, Selenium, APIs, PostgreSQL and LLM integration via Groq to support compatibility analysis and content.

VinanceOS – Data and quantitative research platform 2026

- Full-stack project with FastAPI, PostgreSQL, React, ML pipelines, causal backtesting and walk-forward validation in a simulation/paper-trading environment.

Pilar – Spanish and English learning PWA 2026

- Offline-first PWA (SvelteKit, TypeScript, IndexedDB, Supabase) with a curriculum organized by CEFR levels (A1–B2), review flashcards, speech practice and AI writing feedback (Gemini); covered by unit, contract and Playwright browser tests. Live at estudo.vinmedrado.com.

EDUCATION

Technologist Degree in Data Science (Brazil) – Cruzeiro do Sul Jun 2025 – Jun 2027 (in progress)

Bachelor's Degree in Business Administration (Brazil) – FMU (online) 2023 – Dec 2027 (expected)

Technical Diploma in Administration – Senac Santo André Jun 2018 – Jun 2020

LANGUAGES

Portuguese: Native
Spanish: Basic (daily self-study)
English: Basic (daily self-study)
